

A Randomized, Double-blind, Placebo-controlled, Multicenter Trial, Assessing the Impact of Inclisiran on Major Adverse Cardiovascular Events in Participants With Established Cardiovascular Disease (VICTORION-2 PREVENT)

Status: Recruiting

Eligibility Criteria

Sex: Male or Female

Age Group: 18 years and over

This study is NOT accepting healthy volunteers

Inclusion Criteria:

- at least 40 years old - fasting LDL-C at least 70 mg/dL - stable (greater than or equal to 4 weeks) and well-tolerated lipid-lowering regimen including a high-intensity statin therapy (atorvastatin or rosuvastatin) - any of the following three conditions 1) heart attack (myocardial infarction), 2) stroke, or 3) symptomatic peripheral arterial disease (PAD)

Exclusion Criteria:

- Heart attack, stroke, peripheral arterial revascularization procedure or amputation due to atherosclerotic disease less than 4 weeks - treatment with PCSK9 inhibitors (evolocumab or alirocumab) within past 90 days - planned or expected cardiac, cerebrovascular or peripheral artery surgery or re-vascularization within the 6 months starting the study - cancer treated with surgery radiation therapy and/or systemic therapy during the past 3 years - other significant medical conditions (study staff will review) - women who are pregnant or breast feeding

Conditions & Interventions

Conditions:

Heart & Vascular

Keywords:

Atherosclerotic Cardiovascular Disease, Clinics and Surgery Center (CSC), Heart Attack, Myocardial Infarction, PAD

More Information

Description: The purpose of this study is to learn whether the study treatment, inclisiran, taken in addition to standard cholesterol-lowering medication, can safely reduce the risk of heart attack, stroke, and other serious heart-related events in people with established cardiovascular disease.
